

NETWORK-BASED SERVER CODE AUTO UPGRADE METHOD AND SYSTEM

ABSTRACT OF THE DISCLOSURE

A network-based server code auto upgrade method and system is proposed, which is designed for use with a network system, such as intranet, extranet, or Internet, that is
5 linked to a cluster of servers of the same type for the purpose of upgrading the server code in each of the servers in an automatic manner to a new version of server code via the network system. Compared to old practice, the proposed auto upgrade method and system allows a cluster of servers of the same type to be upgraded automatically one by one via the network system without requiring network system management personnel to manually
10 install the new version of server code into each of the servers one by one so as to help allow network management more efficient
